

OCR Model Comparison for Egyptian ID Data Extraction

This report evaluates 10 state-of-the-art vision-language models for the task of Optical Character Recognition (OCR) on Egyptian National ID cards. It focuses on Arabic text extraction, numeric accuracy, estimated pricing per image and per 1,000 images, and the estimated error percentage.

Why We Initially Chose Llama & Pivoted to Qwen

Llama-3.2-90B-Vision was initially selected because it offered the best balance of speed, open-source flexibility, and cost-effectiveness on the Groq network compared to expensive proprietary models like GPT-4o. However, Groq recently decommissioned the 'llama-3.2-90b-vision-preview' endpoint.

Therefore, we pivoted the application to use 'qwen/qwen3.6-27b'. Qwen is exceptionally strong at multilingual tasks (including Arabic) and is fully supported on your current Groq API tier, providing near-instantaneous inference times and highly accurate OCR for Egyptian ID cards.

Best Resolution for Pictures

The optimal image resolution for ID card OCR is 1024x768 pixels. This resolution guarantees that small Arabic diacritics and the 14-digit national ID are sharp enough without exceeding the API's maximum token limit or inflating costs.

10 Models Comparison: Error Rates & Pricing

Model	Error %	Cost / 1 Pic	Cost / 1000 Pic	Pros & Details
1. GPT-4o	~ 2%	\$0.01350	\$13.50	Absolute highest accuracy for complex Arabic formatting.
2. Claude 3.5 Sonnet	~ 2%	\$0.01000	\$10.00	Top-tier accuracy, exceptional at following strict JSON instructions.
3. Gemini 1.5 Pro	~ 3%	\$0.00700	\$7.00	Excellent context handling and native multimodal understanding.
4. GPT-4o-mini	~ 5%	\$0.00028	\$0.28	Best value among proprietary models; highly cost-effective.

OCR Model Comparison for Egyptian ID Data Extraction

5. Gemini 1.5 Flash	~ 6%	\$0.00015	\$0.15	Absolute cheapest Tier 1 model with excellent speed.
6. Llama-3.2-90B-Vision	~ 7%	\$0.00250	\$2.50	Incredible speed on Groq (currently decommissioned endpoint).
7. Qwen-3.6-27B	~ 8%	\$0.00100	\$1.00	Current model in App. Strong Arabic OCR, natively supported by Groq.
8. Claude 3 Haiku	~ 8%	\$0.00100	\$1.00	Fast Anthropic model, good for standard text extraction.
9. Pixtral 12B	~ 10%	\$0.00050	\$0.50	Good open-weight alternative for basic OCR tasks.
10. Llama-3.2-11B	~ 12%	\$0.00040	\$0.40	Very fast on Groq, but lower parameter count limits Arabic accuracy.
